## Approximations with Tangent Lines

Approximate  $f(x) = x^2$  for  $x$  near 3:  $a = \underline{3}$   $f(a) = \underline{\hspace{2cm}}$   $f'(a) = \underline{\hspace{2cm}}$

tangent line at  $x = a$ :  $y = \frac{\hspace{1cm}}{\text{height at } a} + \frac{\hspace{1cm}}{\text{slope at } a} \times \frac{\hspace{1cm}}{\text{step from } a}$

tangent line at  $x = 3$ :  $y = \underline{\hspace{10cm}}$

$x$	step	estimate of $x^2$	actual $x^2$
3.1	<u>          </u>	<u>          </u>	<u>          </u>

## The Second Derivative and Concavity

Sketch graphs of a function  $f(x)$  with:

## Concavity from Tabular Data

$C(t)$  gives the number of passenger cars (in millions) in US in year  $t$

$t$	1940	1950	1960	1970	1980
$C(t)$	27.5	40.3	61.7	89.2	121.6

estimate of  $C'(t)$                                             

From 1940 to 1980, does  $C'(t)$  **increase** or **decrease**?

Sign of  $C''(t)$ ?
